Dear Mr. Andrade,

It was nice seeing you again last Sunday and continuing our discussion regarding the Aho case. Please find enclosed a manuscript by Ahrens et al. These authors did a recent (1986) study in West Germany in 100 male laryngeal cancer patients. Their most remarkable finding is a highly increased risk for laryngeal cancer for workers in the leather- and textile industries, also after adjustment for smoking and drinking. Please consider this manuscript as confidential as it has not yet been published. It has been submitted for publication. I will let you have the exact reference, as soon as it has been published.

With best regards,

sincerely yours,

Prof. Dr. G.B. Snow

P.S. Another study that might be of interest and about which I am not quite sure whether I have informed you or not is: Flanders, W.D., Rothman, K.J. (1982). Occupational risk for laryngeal cancer. Am.J. Public Health 72, 369-372.
